Tutorial - Make A Cylinder - Part 4 This is the last in my series of posts on how to make a cylinder in AutoCAD, starting with the general concept in Tutorial - Make A Cylinder - Part 1. See the end of the post for links to the earlier posts. See also the post on how to make a doughnut in AutoCAD, as well as the post on making an egg in AutoCAD, and the post on making a sphere in AutoCAD. Steps in the tutorial on how to make a cylinder in AutoCAD The next step is to measure the diameter of the inside of the cylinder, so we're going to make a small cylinder (cylinder part 3, if you've been following along). We'll make a 10.5 inch diameter cylinder with a height of .5 inch. Make sure that you're using a size of 10.5 on the measurement dialog box. The cylinder will be centered in the lower-right corner of the drawing window, so there will be no 1-inch border on the right edge of the drawing window. Now we'll start with the definition lines for the inside of the cylinder. We'll start with the start-of-polyline line. Start the line and center it in the window. Make sure to click on the left mouse button or else it won't be centered in the window, and you can't edit the line. You can then start the line and then drag to make it longer or shorter as needed. Make sure that the start-of-polyline line has a line style of dashed or (6,1). Next, we'll make a line that defines the radius of the cylinder. Start the line and center it in the window. Click on the left mouse button or else it won't be centered in the window, and you can't edit the line. Now we'll start the line. The line will look like this: Make sure that the start-of-polyline line has a line style of dashed or (6,1). In the measurement dialog box, click on the symbol (circle) for the radius. At the bottom of the dialog box, the radius of the cylinder

AutoCAD Architecture is the world's leading 3D CAD software for professional architecture and urban planning, for the design of buildings, bridges, trains, highways, tunnels, dams, airports, and other major infrastructure systems. AutoCAD Architecture uses the powerful native AutoCAD features, such as dimensioning, surface and area modeling, drafting, geometry, and drafting features, along with 3D modeling features. AutoCAD Architecture was first published on February 14, 2002. AutoCAD Architecture supports the AutoCAD 3D User Interface, which has complete support for rotations, tilting, zooming, panning, and other 3D behaviors. It uses the native AutoCAD tools for dimensioning, surface and area modeling, drafting, and the native Drafting commands. The architecture geometry is all native AutoCAD geometry: vertices, edges, faces, and sweeps. AutoCAD Architecture also provides native 3D model editing commands. These include the ability to undo and redo edits, to change elements' attributes and properties, and to share geometry among multiple applications. It has built-in support for AutoCAD DXF. AutoCAD Architecture was originally based on AutoCAD for Windows 2000 Release 3.5 Service Pack 2, which was released on August 16, 2000. The current release is AutoCAD Architecture 2011.
